# The Tempo of the Universe Related to Performance in Sports 

S. Plagenhoef<br>Parker College, Dallas, Texas, USA

Galileo stated that «Mathematics is the alphabet with which God has written the Universe». Pythagoras stated that «Everything is arranged according to numbers and mathematical shapes». The Greeks recognized a specific proportion that was pleasing to the eye, and the ratio of $62 \%$ to $38 \%$ was called the «Golden rectangle» (2). This proportion was used by architects, painters, sculptors, astrologers, and musicians, and was called the «Golden Mean» and the «law of beauty». The various shapes, based on this proportion, were called the «Golden triangle», «Golden spiral», and «Golden pantogram». All of these shapes are not only man made, as in buildings, art, and music, but they are the basis for all things in nature and the Universe. The Disney television channel showed an animated film- «Donald in Mathmagic Land» on March 16, 1987. It showed how this proportion was the basis for flowers, sea shells, trees, spider webs, snow flakes, the honey bee hive, and the relationship of the planets to the sun. The PBS television series on «The Brain» - «Rhythms and Drives» showed how the human body is affected by certain frequencies of the senses which affect growth and development, how people feel, and how people perform.

For centuries, scholars have recognized a mysterious force permeating the Universe and affecting all plants and animals on earth. Gradually the reason for these feelings has unfolded. The first experiments in electricity, by Volta and Galvani, took place in the early 19th century. Faraday and Maxwell continucd the work in the 1860 's and 70 's, and Edison invented the lamp in 1879. Tesla startcd the electrical industrial revolution at the end of the century with many inventions (1). In 1894
telegraphy, the wireless electromagnetic radiation waves, was invented. and in 1895 radient energy of invisible rays, called X-rays, was discovered. In 1902 electrically charged particles were found in the ionosphere from 30 to 250 miles up. The new astronomy had arrived, and the field is still exploding like a super-nova. In 1932 Jansky discovered radio waves coming from the cosmos, and in 1940 Reber confirmed Jansky's finding (6). Southworth discovered centimeter wavelengths coming from the sun in 1945, and now the solar wind, a constant stream of matter coming from the sun, is being measured (12). In the 1950 's, the first large radio telescope was built in England to study radio waves emitted by the stars (9). In 1967 the discovery of the first «pulsar» was made by Jocelyn Bell and Antony Hewish, and Hewish was awarded the Nobel Prize in 1974 (10). A «pulsar» emits regular pulses of radio waves and is called a «neutron star» because it spins and sends out precisely spaced electromagnetic waves like a revolving lighthouse. The first one revolved every 1.337 seconds, and now over 400 have been measured having periods from .03 to 4 seconds (10, 12).
In 1968 a neutron star was found in the Crab Nebula by the Arecibo Observatory in Puerto Rico (10). At 6000 light years away, it is by far the closest bright pulsar to the earth, and has a period of .033 , or a spinning rate of $30.3 /$ second. In 1969 Cocke, Disney and Taylor, at the Steward Observatory in Arizona, confirmed the pulsar in the Grab Nebula optically, and this was one of the greatest events in the history of modern astronomy (10).

In 1202 Leonardo Fibonacci introduced a set of numbers that increased by $61.8 \%$ that came close to the mathematical basis for the creation of all things from the atom to the total galaxy $(2,8)$. He only used whole numbers, however, and the relationship of the «Golden Mean» to frequencies requires a sequence of numbers based specifically on the «Golden proportion». These corrected Fibonacci numbers can be amplified by using the square root of the numbers as well, which are in harmony with the «Golden Mean» (13). Table 1 shows the corrected numbers to be used.

## TABLE 1

| * Fibonacci Numbers | "* |
| :--- | :--- |
|  | Corrected Fibonacci Numbers |
| 1 | 1 |
| 2 | $1.27201965=$ square root of 1.618 |
| 3 | ${ }^{* * *}$ |
| 5 | $1.6180339=1+\sqrt{5} / 2$ |
| 8 | 2.058 |
| 13 | 3.33 |
| 21 | 4.236 |
| 34 | 5.388 |
| 55 | 6.854 |
| 89 | 8.718 |
| 144 | 11.09 |
|  | 14.106 |

* Each Fibonacci number is obtained by adding the previous two numbers.
** Each corrected number is obtained by multiplying the previous number by 1.272 .
$* *$ The formula $(1+\sqrt{5} / 2)$ is for a line divided in a way that the proportion of cach to the other is the same as each to the whole.

## The Tempos of Sports

Knowing that man is totally linked to the environment, and that functional efficiency is dependent upon living in harmony with the Universe, this knowledge can be applied to performance in sports. It is easiest to apply to those sports that have a foot-fall tempo that can be counted, such as walking or running, or a turn-over tempo to the movement, such as bicycling, swimming, rowing, or kayaking. The rate of turn-over is counted by the mind either on every beat, on every other beat, or on the first beat of a measurc. A person dancing a waltz should feel the emphasis on the first beat of the three, and not single out cach beat. The runner or bicycler going fast probably has the mind attuned only to the first beat of four beats, while the slower turnover of a swimmer or kayaker probably has the mind attuned to every two beats. The mind's tempo determines what time interval is selected for performance. Table 2 shows the prime and harmonic tempos of the corrected Fibonacci numbers. Table 3 presents the beats per minute when the mind is attuned to 1,2 or 4 beats. Table 4 presents work to rest ratios based on Table 2.

There is also a rhythm to the movement itself, such as in golf or tennis,
where the backswing of the motion should take $62 \%$ of the total time, and the forward motion shoald take $38 \%$ of the time. When the forward motion is rushed, and the "Golden proportion" is broken, performance will be worse and the athlete will not feel the «rhythm». There is a rhythm to the steps of a high jumper, the turns of a hammer thrower, the swing of a batter, and even to the pattern of team movements in hockey, soccer and basketball.

The application of the «Golden proportion» to the work/rest ratio of the sport is essential. A person walking should rest a certain length of time per hour. Using Table 4 , a slow walker could use the ratio of $85.4 \%$ walk to $14.6 \%$ rest. This would require a rest of nine minutes every hour. Long distance performances should have a certain percentage of "coasting» when it is not possible to stop. Sports that are intense for short periods of time require longer rest periods. A runner doing interval work should rest $85.4 \%$ and run $14.6 \%$ of the time, or select another ratio based on fitness. The more energy expended, the greater the rest period needed. Tables 5, 6 and 7 present the information needed to select a tempo of performance and a work to rest ratio for some selected sports. Similar numbers can be calculated for any activity using Tables 2, 3 and 4.

TABLE 2
Corrected Fibonacci Series

| Prime tempo <br> sec | Harmonic tempo <br> sec | Tempo/59.76 <br> sec | Tempo/60 <br> sec |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| .1147 | .1017 | 521 | 587.6 |  | 590 |
| .1459 | .1294 | 409.6 | 462 | 523 |  |
| .1856 | .1645 | 322 | 363.2 | 411 | 464 |
| .2361 | .2093 | 253.1 | 285.5 | 323 | 365 |
| .3003 | .2662 | 199 | 224.4 | 254 | 287 |
| .382 | .3387 | 156.5 | 176.5 | 200 | 172 |
| .4859 | .4308 | 123 | 138.7 | 157 | 139 |
|  | .548 |  | 109.1 |  | 109.5 |

| . 618 |  | 96.7 |  | 97 |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | . 697 |  | 85.7 |  | 86 |
| . 7861 |  | 76 |  | 76 |  |
|  | . 88665 |  | 67.4 |  | 68 |
| 1.0 |  | 59.76 |  | **60 |  |
|  | 1.1278384 |  | 53 |  | . 53 |
| 1.272 |  | 47 |  | 47 |  |
|  | 1.435 |  | 41.7 |  | 42 |
| 1.618 |  | 36.9 |  | 37 |  |
|  | 1.825 |  | 32.7 |  | 33 |
| 2.058 |  | 29 |  | 29 |  |
|  | 2.321 |  | 25.7 |  | 26 |
| 2.618 |  | 22.8 |  | 22.9 |  |
|  | 2.953 |  | 20.2 |  | 20.3 |
| 3.33 |  | 17.9 |  | ***18 |  |
|  | 3.756 |  | 15.9 |  | 16 |
| 4.236 |  | 14.1 |  | 14.2 |  |
|  | 4.778 |  | 12.5 |  | 12.6 |
| 5.388 |  | 11.1 |  | 11.1 |  |
|  | 6.077 |  | 9.8 |  | 10 |
| 6.854 |  | 8.7 |  | 8.8 |  |
|  | 7.73 |  | 7.73 |  | 7.8 |

* The Fibonacci Series must be changed from a 59.76 second minute to 60 seconds.
* If the prime tempo is 1 beat per second, there would be 60 beats per minute.
*** If the prime tempo is 3.33 seconds per beat, there would be 18 beats per minute.

$161 / 2=102$ hours
66
$141 / 2=$ to 3 hours
58

## How to Select a Tempo for Any Sport

The tempos given in Tables 5-7 were determined by first measuring the tempo's of athletes during competition. This gives a general range of times of foot-falls or turn-overs per minute. It can be done with a stop watch, films, or video. Table 3 shows the «Golden Mean» beats per minute for performance attuned to 1,2 or 4 beats. One can determine how the mind is thinking by counting your own steps. Do you count from 1 to 100 consecutively, or $1,2-2,2-3,2-4,2$ so it is necessary to multiply by 2 to get the number of steps. Most people count $1,2,3,4-2,2,3,4-3,2,3,4$, and then multiply by four. The time interval is the «magic number» and the best tempo is based on column one of Table 3.

It is very easy in some sports to determine the tempo. When running in competition, the breathing pattern fits the foot-fall pattern. Because the turnover rate is so high, most everyone will count by 4's. A rower touches the water with the blade on the first beat of every four. When listening to music, the mind will be attuned to the first beat of a measure. Table 3 shows that dancing will feel the best if the music has 18,23 or 29 four beat measures per minute. The next best, in harmony, are 20,26 or 33 four beat measures per minute. If there are 18 measures, the dance is slow, and if there are 33 measures, the dance is fast. Therefore, dancing is usually most enjoyable at 23,26 or 29 four beat measures per minute.

To match movement patterns to the correct tempo, the tempo must be sct with a metronome, or piece of music. Kayaking is a good example of how different music tempos may be used. If the music is sufficiently slow to place each blade in the water on every beat, the boat is in a sprint. The mind would be attuned to cvery beat, and Table 7 shows that 97 or 109 strokes per minute would be best. If the music is fast, every two beats would synchronize with each blade entry, and 94 or 106 strokes per minute would be best. This is one sport where music can be played during the paddling, and a chossen tempo can assure a rhythmic pattern that will enhance performance.

There are certain tempos that are best for daily use that many people use without knowing about the «Golden Mean». Walk at 29 four beat measure per minute. Don't change the tempo, change the stride length to fit your ability. Run distances at 188 steps or 47 four beat measures per minute. This is the tempo of most marathoners. Swim at $2 l$ four beat measures for distance work, or ride your bike at 42 four beat measures for distance work. Best of all, you can dance all night at the magic tempo of 23 four beat measures per minute.
