

in such a way as to be incompatible with predicates that don't have the subinterval property and those under negation to derive an actuality inference. The formal similarities to FC is also shown to have promising consequences for understanding UPs' interactions with presuppositional elements, in light of recent work on interactions between presupposition and implicature.

The analysis presented here also raises questions about what role the mechanisms that derive the properties of UPs play in other temporal adverbs. A general theory will have to explain why some adverbs have these properties and some don't.¹⁹ The logic of this account suggests that it should follow from the semantics and alternatives attributed to each item as well as their obligatory vs optional interaction with EXH.²⁰ In future work, I hope to not only explore these challenges but investigate whether similar pragmatic approaches can help to explain the properties of durational adverbs (*for an hour*) and the *in years* class of polarity sensitive adverbials.
